

Help shape the future of general practice through the OCEAN study

The OCEAN (Occasions of Care Explained and Analysed) study is a national research program providing unique insights into care provided by multidisciplinary health professionals in Australian general practice. OCEAN is building a national evidence base on how general practices, Aboriginal Medical Services and Aboriginal Community Controlled Health Services deliver team-based care. Study data will inform the case for better support and resourcing at the national level and ensure that future policy is informed by real-world practice.

Right now there are two ways to get involved:

1. If you are a **practice manager** or **practice owner** we invite you to complete the OCEAN Practice Profile, which captures key information about your practice, including your team, size and services. It takes most people 10-20 minutes to complete. Check your inbox for your practices' personalised invitation or scan the QR code to express your interest.

2. If you are a **nurse**, **nurse practitioner** or **physiotherapist** working in **these settings** tell us about your skills, education and experience by completing the OCEAN Professional Profile. It takes most people 10-20 minutes to complete and has been designed by nurses and physiotherapists as an opportunity to reflect your real work—not just what is assumed or recorded elsewhere. If you work at a practice that has completed the Practice Profile you may have received an email invitation. Otherwise, please scan the QR code to express your interest.

Your participation counts!
